

## NAVIGATION BAR

- Home – **index.html**, still need to sort out what exactly all is going to be displayed on page: banner, few images?, “Who We Are” section, and customer reviews??
- Products – drop-down menu with hyperlinks that will lead to product pages—cakes, cookies, cupcakes, wedding cakes.
  - Currently, only the cakes page is working. I am sure we can either reuse the files as templates for the other products or even have one set of template files for the whole products section
    - **cake\_products\_listing.php** – this is the redirect page when “Cakes” is clicked on the navigation bar. It displays the images of the cakes as well as the name that is stored in the database. This page is unformatted. Clicking the name will start and order form and take the user to the **cake\_customization.php** page
    - **cake\_customization.php** – the user can customize the product they have selected. After customizing to their liking, they will select a submit button that will send their order to the “order\_cakes” table in the database.
    - **admin\_upload\_cake\_products.php** – intended for admin-used only: the admin user can upload a new cake to the data base. They enter a cake name and upload an image alongside it. The data goes to the “cake\_products” table in the database.
    - **cake\_products\_db.php** – stores the data entered in the **admin\_upload\_cake\_products.php** form into the “cake\_products” table in the database.
- Gallery – I know we discussed just having a small content section with just a few images of previous creations, but the clients seemed to like the idea of having a gallery page.
  - Currently, the page is working to display images that are uploaded through a form to a database. The gallery display page is not yet formatted with CSS.
    - **display\_gallery.php** – displays images that have been uploaded to the “gallery” table in the database

- **gallery\_database.php** – stores images and image data to “gallery” database that have been uploaded by an admin user
  - **gallery\_upload.php** - intended for admin-use only: the admin can upload a photo that will be immediately displayed on the “Gallery” page; currently, the images must be selected from the “images” file
- Visit Us – **contact.html**, formatted rough idea of a contact page, open to changes and suggestions

## OTHER

- Account
- **login.html** – account login page, Star has worked with the forms, so my code is not current
  - **register.html** – register account page, code not current
- Database
- **cake\_testing.sql** – the database I have been using. To import it, using phpMyAdmin, create a database called “cake\_testing” and then import the sql file.
